网络数据爬取

用Python获取网络数据

A tilted screenshot of a stock market data table. The table has three columns: 'Symbol', 'Company Name', and 'Price'. The data is as follows:

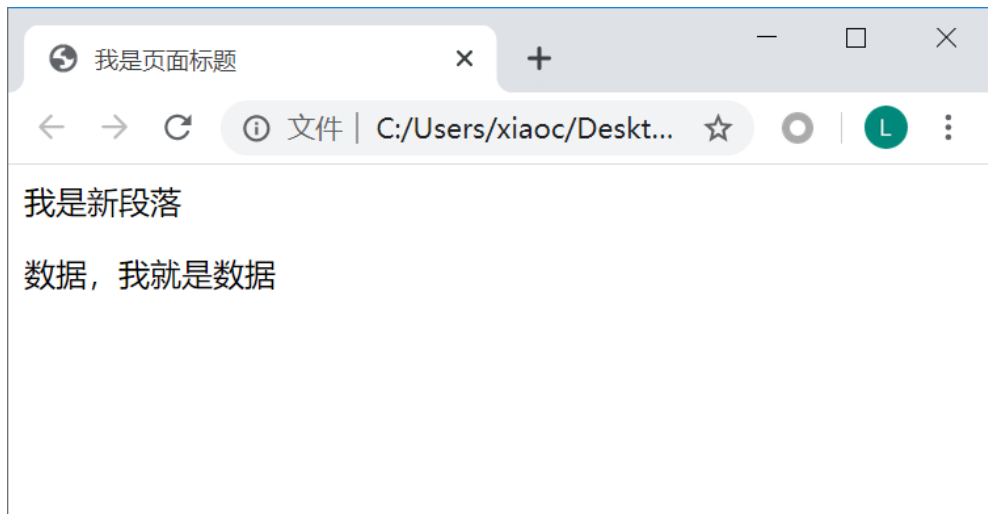

Symbol	Company Name	Price
OK	Nokia Corporation	8.4
APL	Apple Inc.	104.7
AC	Bank of America Cor...	16.6
	AT&T, Inc.	33.5
BR	Petr	12.5
QQ	PowerShares QQQ	97.9
3	Facebook, Inc.	80.0
IO	iBio, Inc.	1.4
ELP	Yelp, Inc.	58.5
IFN	Infinera Corporation	13.0
SFT	Microsoft Corporation	44.7
O	The Coca-Cola Comp...	41.2
FF	Pfizer Inc	28.8

API获取数据

网络数据如何获取（爬取）？

抓取网页，解析网页内容

- 抓取
 - Requests第三方库
 - Scrapy框架
- 解析
 - BeautifulSoup库
 - re模块

```
<html>
<head>
<title>我是页面标题</title>
</head>

<body>
<p>我是新段落</p>
数据，我就是数据
</body>

</html>
```

参考：

http://www.w3school.com.cn/html/html_backgrounds.asp

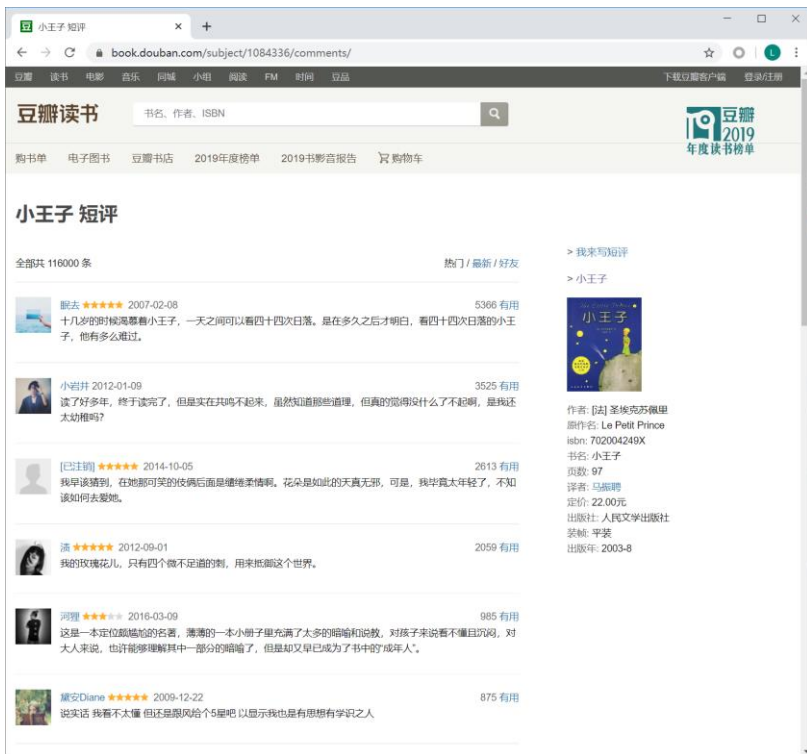

Requests库

- Requests库是更简单、方便和人性化的Python HTTP第三方库
- Requests官网：
<http://www.python-requests.org/>

\$ pip install requests
(Anaconda中预装)

豆瓣读书 《小王子》短评

requests.get()

请求获取指定URL位置的资源，对应HTTP协议的GET方法，返回一个Response对象

```
>>> import requests
```

```
>>> r = requests.get('https://www.nju.edu.cn')
```

```
>>> r.status_code
```

```
200
```

```
>>> print(r.text)
```

```
>>> r = requests.get('https://book.douban.com/subject/1084336/comments/')
```

```
>>> r.status_code
```

```
418
```

```
>>> headers = {'User-Agent': 'Mozilla/5.0 (Macintosh; Intel Mac  
OS X 10_14_0) AppleWebKit/537.36 (KHTML, like Gecko)  
Chrome/71.0.3578.98 Safari/537.36'}  
>>> r = requests.get(url, headers = headers) #定制请求头  
>>> payload = {'key1': 'value1', 'key2': 'value2'}  
>>> r = requests.get('http://httpbin.org/get', params = payload)  
>>> r = requests.post(url, data = payload)
```

```
>>> r.encoding      # 根据HTTP头部自动推测
```

```
'UTF-8'
```

```
>>> r.encoding = 'gb2312'
```

```
>>> r.encoding = r.apparent_encoding
```

```
>>> r.content      # 以字节方式访问Response对象
```

```
>>> r.json()
```

r.content

以字节方式访问Response对象

```
r = requests.get('http://...sample.jpg')
with open('pic.jpg', 'wb') as f:
    f.write(r.content)
```

- JSON格式

- JavaScript Object Notation, JS对象标记)
- 一种轻量级的数据交换格式

r.json()

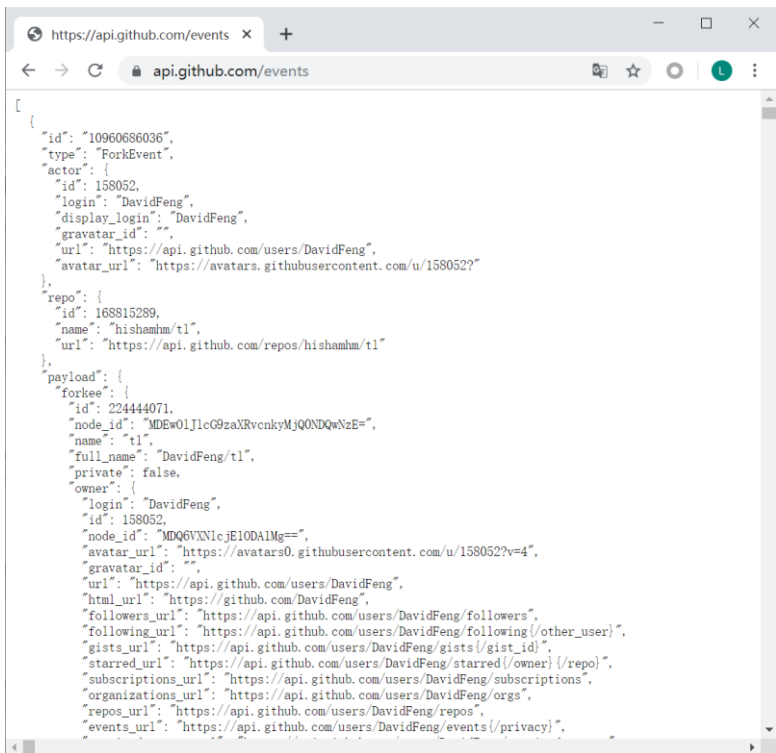

```
'{"name":"Niuyun", "address":{"city": "Beijing", "street":  
"Chaoyang Road"}}'
```

解析后

```
>>> x = {"name":"Niuyun",  
         "address":{"city":"Beijing","street":"Chaoyang Road"}}  
>>> x['address']['street']  
'Chaoyang Road'
```

JSON文件

13

网页数据解析

- **Beautiful Soup**是一个可以从HTML或XML文件中提取数据的Python库
- 官方网站：
<https://www.crummy.com/software/BeautifulSoup/bs4/doc/>

Beautiful Soup

- \$ pip install beautifulsoup4 (Anaconda中预装)

```
>>> import requests
```

```
>>> from bs4 import BeautifulSoup
```

```
>>> r = requests.get('https://book.douban.com/subject/1084336/comments/',  
headers = headers)
```

```
>>> soup = BeautifulSoup(r.text, 'lxml')
```

lxml: HTML解析器
\$ pip install lxml

Python内置的HTML解析器
BeautifulSoup(markup, 'html.parser')

Beautiful Soup

- BeautifulSoup对象
 - Tag

```
>>> markup = '<p class="title"><b>The Little Prince</b></p>'
>>> soup = BeautifulSoup(markup, 'lxml')
>>> soup.b
<b>The Little Prince</b>
```
 - NavigableString
 - BeautifulSoup
 - Comment

标签内容访问方式
BeautifulSoup对象.Tag

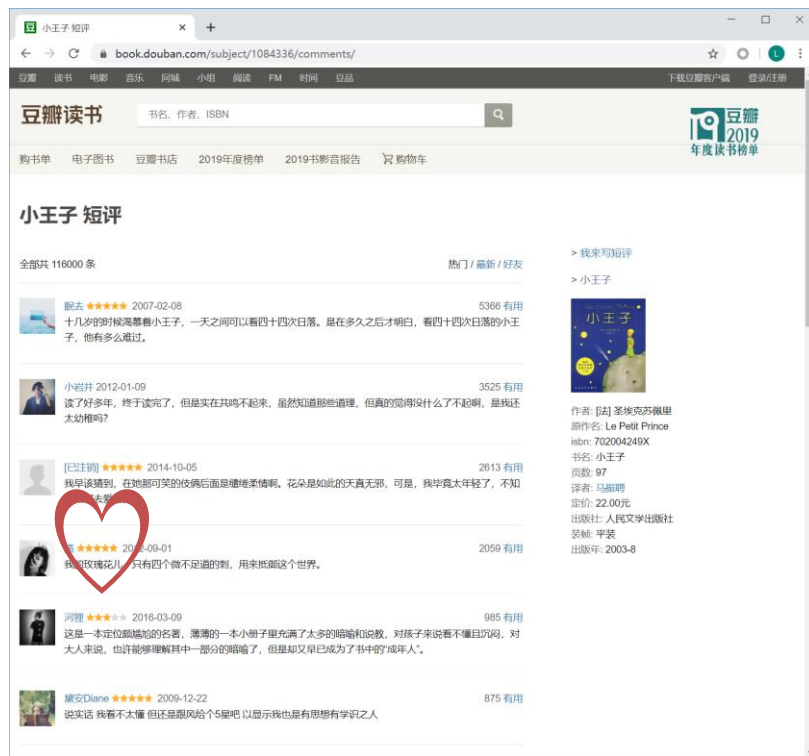

Beautiful Soup

```
>>> markup = '<p class="title"><b>The Little Prince</b></p>'
>>> soup = BeautifulSoup(markup, 'xml')
>>> tag = soup.p
>>> tag
<p class="title"><b>The Little Prince</b></p>
>>> tag.name
'p'
>>> tag['class']
['title']
>>> tag.attrs
{'class': ['title']}
>>> tag.string
'The Little Prince'
>>> soup.find_all('b')
[<b>The Little Prince</b>]
```

``不知道第几次重读。每过一段时间再读，都有新的收获。心变得很柔软，脑里的迷雾被驱散。更多的关注他人，关心这个世界，自私是多么无趣的事情啊。我想，写一本能温暖人心，帮助困难的人们的书，比世界上很多事情都有意义。``

```
pattern = soup.find_all('span', {'class':'short'})
for item in pattern:
    print(item.string)
```

```
r = requests.get('https://book.douban.com/subject/1084336/comments/',  
headers=headers)  
  
soup = BeautifulSoup(r.text, 'lxml')  
  
pattern = soup.find_all('span', {'class':'short'})  
  
for item in pattern:  
    print(item.string)
```

豆瓣读书 《小王子》推荐星级

- 正则表达式是对字符串（包括普通字符和特殊字符）操作的一种逻辑公式
- **re**正则表达式模块进行各类正则表达式处理
- 参考网站：
<https://docs.python.org/3.5/library/re.html>

元字符	描述
.	匹配除换行符外的任意字符
*	重复前面的子表达式0次或多次
+	重复前面的子表达式1次或更多次
?	重复前面的子表达式0次或1次
^	匹配字符串的开始
\$	匹配字符串的结束
{n}	重复n次
{n, }	重复n次或更多次
{n, m}	重复n到m次
\b	匹配单词的开始或结尾即单词边界, “\B” 匹配非单词边界
\d	匹配数字, “\D” 匹配任意非数字字符
\s	匹配任意空白符, “\S” 匹配任意非空白符
\w	匹配任意字母、数字或下划线的标识符字符, “\W” 匹配任意非标识符字符
[a-z]	匹配指定范围内的任意字符
[^a-z]	匹配任何不在指定范围内的任意字符

```
<span class="user-stars  
allstar50 rating" title="力荐  
></span>
```

```
'<span class="user-stars allstar(.*) rating'
```

```
pattern = re.compile('<span class="user-stars allstar(.*) rating')  
p = re.findall(pattern, r.text)
```

```
r = requests.get('https://book.douban.com/subject/1084336/comments', headers = headers)
```

```
soup = BeautifulSoup(r.text, 'lxml')
```

```
pattern = soup.find_all('span', {'class':'short'})
```

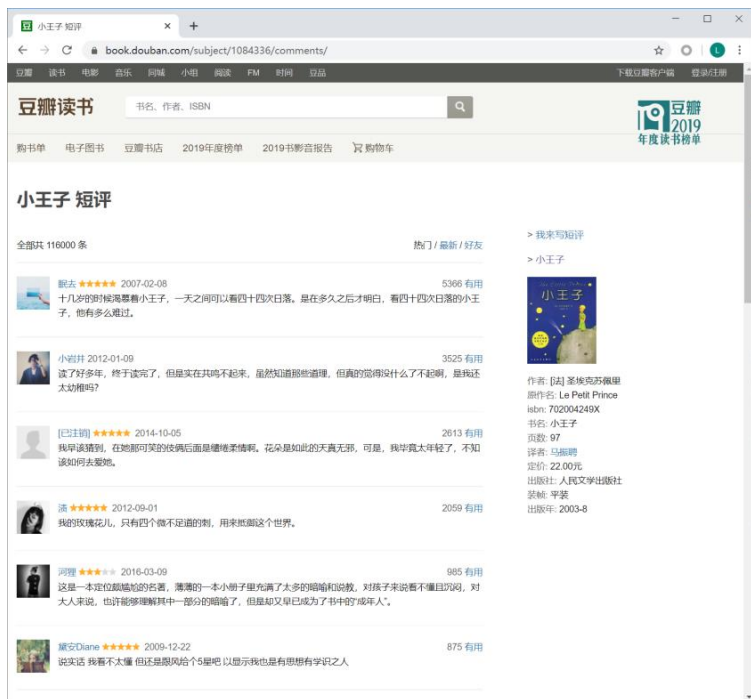

```
for item in pattern:
```

```
    print(item.string)
```

```
pattern_s = re.compile('<span class="user-stars allstar.*?) rating"')
```

```
p = re.findall(pattern_s, r.text)
```

思考：抓取图书短评前5页

<https://book.douban.com/subject/1084336/>

```
r =  
requests.get('https://book.douban.  
com/subject/1084336/comments/h  
ot?p=' + str(i+1))
```

<http://money.cnn.com/data/dow30/>

抓取道指成分股数据并将30家公司的代码、公司名称和最近一次成交价放到一个列表中输出
